

## Balancing Valves

FIG 900S Venturi Commissioning Station (FODRV)  
Female x Female DN15-DN50

### Dimensions

BOSS™ 900S

BOSS™ 900S Venturi FODRV DN15-50

### Specification

The commissioning station and DRV incorporates a characterised regulating needle combined with an isolating ball valve. The double regulating feature allows the valve to be isolated without movement of the set regulation point. The needle is regulated using an allen key. The valve is suitable for mounting in any orientation.

The flow rate is measured using a fixed orifice Venturi cartridge with double seal test points inserted into the valve body. These functions are incorporated into a single fitting which contains any up and down stream lengths required for laminar flow conditions except when installed in close proximity to a pump. The commissioning valve should produce a signal of between 10 – 60kPa except on the ultra low flow valves where the signal should be between 1 – 4.7kPa. The valve is suitable for mounting with the test points pointing down. The commissioning station has an accuracy of +/-3%.

### Weights & Dimensions – FODRV Female x Female

Size DN	Nominal Size	A mm	B mm	C mm	D mm	Weight kg	Product Code
15UL	1/2in	94	75	144	76	0.405	22073188
15L	1/2in	94	75	140	76	0.405	22073199

## Flow Measurement

Flow measurements are via the Venturi nozzle. The BOSS™ Venturi has two test points (P/T plugs). The high pressure test point is identified by the RED retaining clip and the low pressure test point is identified by the BLUE retaining clip. The pressure differential measured between these test points can be used to calculate the actual flow through the Venturi. This differential can be measured using a flow meter or other measuring device. This is converted into a flow rate of litres per second (l/s) or metres cubed per hour ( $m^3/h$ ) either electronically or using a calculation formula.

## Valve Sizing

Sizing disc available on request via your local BSS branch or the BOSS™ Technical Team on 0116 245 5940.

### Calculation of flow rate

$$Q = \frac{K_{vs} \sqrt{\Delta P}}{36}$$

where

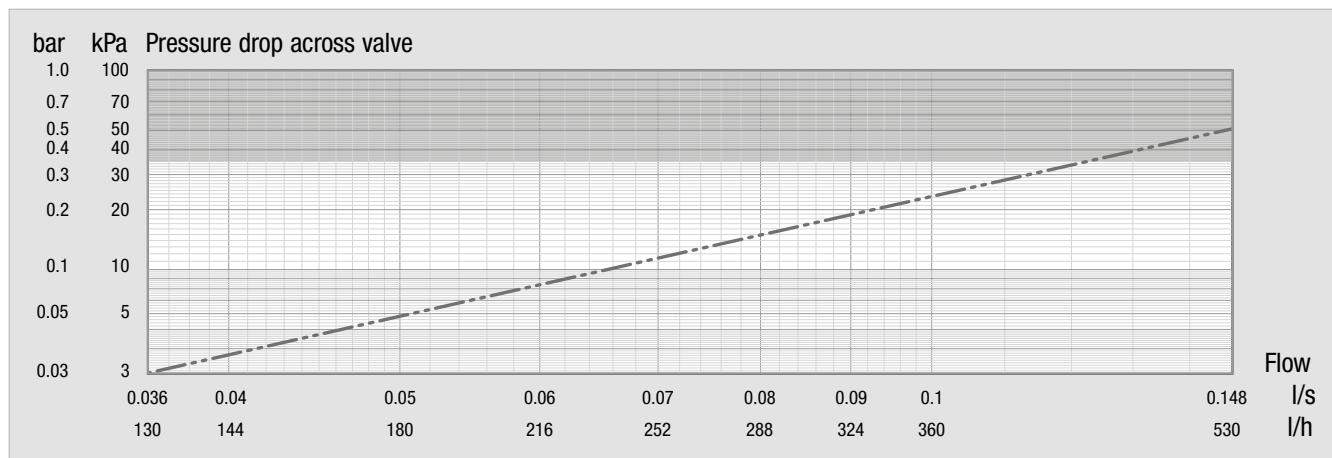

$Q$  = flow rate (l/s)  
 $\Delta P$  = Signal (kPa)  
 $K_{vs}$  = Signal coefficient
